SUMMARY

Highly skilled Senior Backend Developer with over 8 years of experience designing and implementing scalable distributed systems. Expert in microservices architecture, API optimization, and cloud infrastructure management across various high-traffic environments. Proven track record of improving system performance by 40% and leading cross-functional engineering teams to deliver robust, enterprise-grade software solutions using Java, Go, and Python.

SKILLS

Programming Languages: Java, Go, Python, SQL, C++, Node.js, Ruby.

Frameworks and Tools: Spring Boot, Gin, Django, Kubernetes, Docker, Terraform, Jenkins, Git.

Databases and Caching: PostgreSQL, MongoDB, Redis, Cassandra, Elasticsearch, DynamoDB.

Cloud and DevOps: AWS (EC2, S3, Lambda, RDS), Google Cloud Platform, CI/CD, Prometheus, Grafana.

Architecture: Microservices, RESTful APIs, gRPC, Event-Driven Architecture, Apache Kafka, RabbitMQ.

PROFESSIONAL EXPERIENCE

TECHFLOW SOLUTIONS

Lead Backend Engineer | January 2021 - Present

Lead the comprehensive architectural redesign of a core payment processing engine, successfully migrating from a monolithic structure to a Go-based microservices architecture to improve scalability.

Optimized complex database queries and implemented advanced caching strategies using Redis, resulting in a documented 45% reduction in API response latency across 60+ critical endpoints.

Architected a high-concurrency real-time data streaming pipeline using Apache Kafka to process over 5 million events daily for financial reporting, auditing, and automated fraud detection.

Managed a distributed team of 12 senior and mid-level developers, implementing Agile methodologies and rigorous code review standards that decreased production bug reports by 30% annually.

Orchestrated the migration of legacy on-premise infrastructure to AWS using Terraform for Infrastructure as Code, achieving 99.99% system uptime and reducing monthly operational costs by \$18,000.

Developed custom automated integration testing frameworks that increased total code coverage from 65% to 94%, significantly streamlining the continuous deployment pipeline and release velocity.

DATASTREAM INC.

Senior Software Engineer | March 2017 ? December 2020

Designed and implemented a high-throughput RESTful API using Java and Spring Boot to support a global mobile application with over 750,000 monthly active users and high peak-time traffic.

Integrated enterprise-grade third-party OAuth2 authentication and multi-factor authorization protocols to enhance platform security and ensure compliance with international data privacy regulations.

Collaborated closely with DevOps teams to containerize modular application components using Docker and Kubernetes, facilitating seamless horizontal scaling and zero-downtime deployments.

Developed a centralized logging and monitoring ecosystem using ELK Stack (Elasticsearch, Logstash, Kibana) and Prometheus, reducing the mean time to recovery (MTTR) by 40% for critical errors.

Refactored legacy Python batch processing scripts into optimized asynchronous background worker processes, improving total data ingestion speeds by 55% for large-scale enterprise datasets.

Mentored five junior developers through structured pair programming sessions and technical workshops, fostering a culture of continuous learning and high-quality engineering practices.

CORE SYSTEMS GROUP

Software Engineer | June 2014 ? February 2017

Developed and maintained core backend services for an e-commerce platform using Python and Django, focusing on inventory management modules and real-time stock synchronization.

Implemented a scalable search functionality utilizing Elasticsearch, which improved the accuracy of user search results and decreased search query time by approximately 300ms per request.

Contributed to the design of a proprietary internal API gateway that standardized communication between front-end interfaces and various legacy backend databases.

Automated repetitive server maintenance tasks and deployment scripts using Bash and Ansible, saving the engineering department over 15 hours of manual labor per week.

PROJECTS

Distributed Task Scheduler

Engineered a fault-tolerant, high-availability task scheduling system in Go that handles millions of scheduled jobs with exactly-once delivery semantics using PostgreSQL and Redis for state management.

Implemented a custom leadership election algorithm to ensure system reliability even during significant network partitions or node failures within a multi-region deployment.

Open Source API Gateway Contribution

Contributed major performance enhancements to a popular open-source API gateway project, specifically focusing on the development of rate-limiting modules and dynamic routing logic.

Optimized the memory footprint of the routing engine, allowing the gateway to handle 20% more concurrent connections on standard hardware configurations.

EDUCATION

Georgia Institute of Technology

Master of Science in Computer Science

University of Washington

Bachelor of Science in Software Engineering

CERTIFICATIONS

AWS Certified Solutions Architect ? Professional

Certified Kubernetes Administrator (CKA)

Oracle Certified Professional: Java SE Programmer
